

Group 5 Ricochet Robots Instructions

The program was run and tested on both windows and macOS.

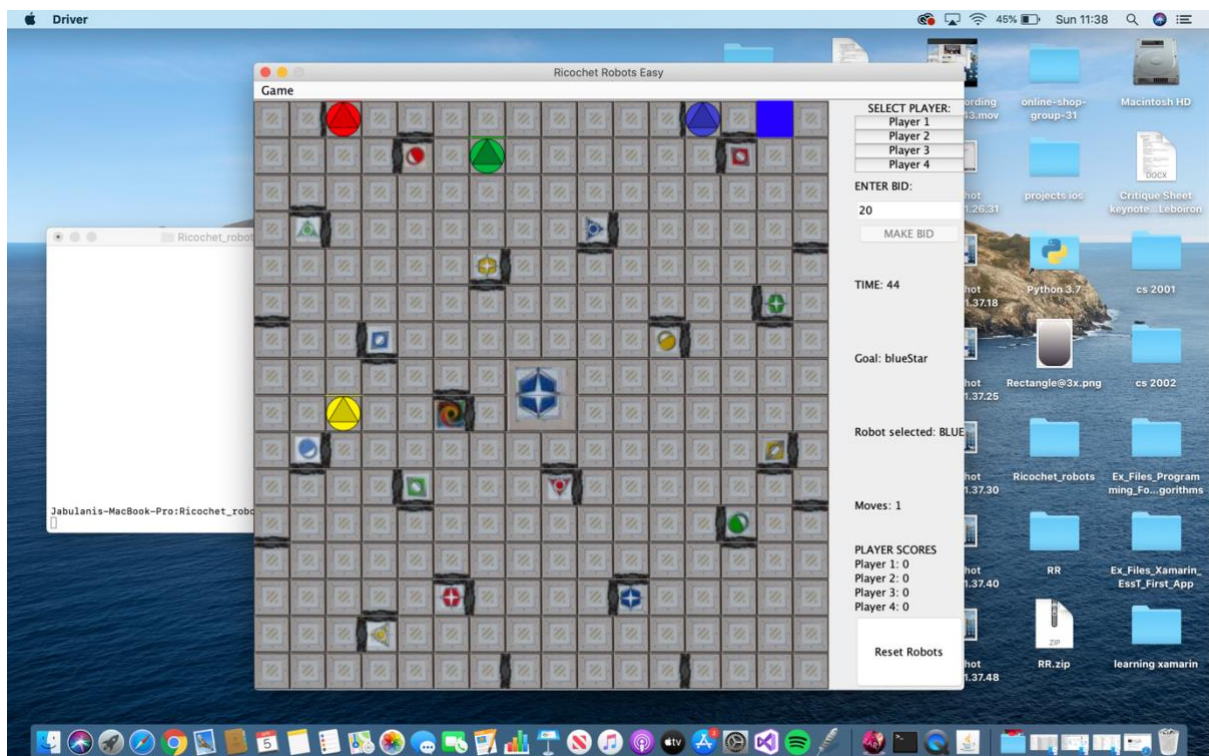

The screenshots in this file are from a run on macOS 10.15.4 and the Java version is 14.

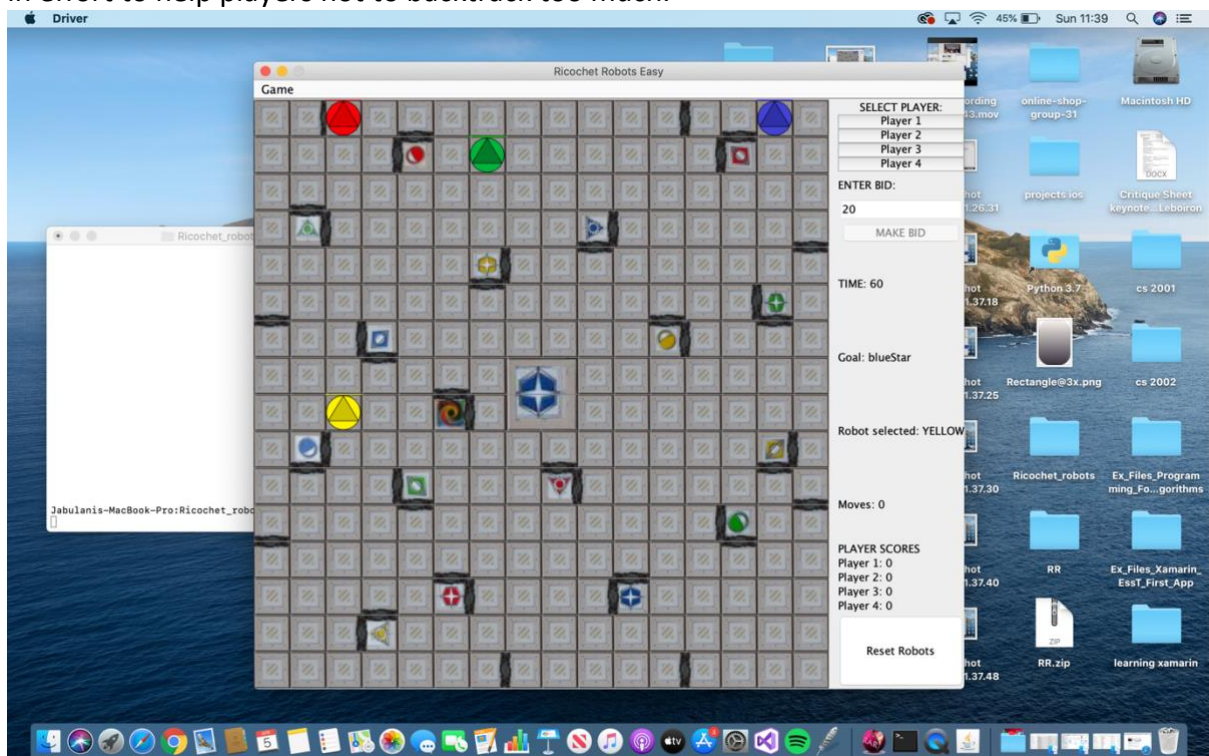

Once a player has made a bid the timer will count down. Players must first select a robot and the selected robot is indicated by the robot selected label on the right panel.

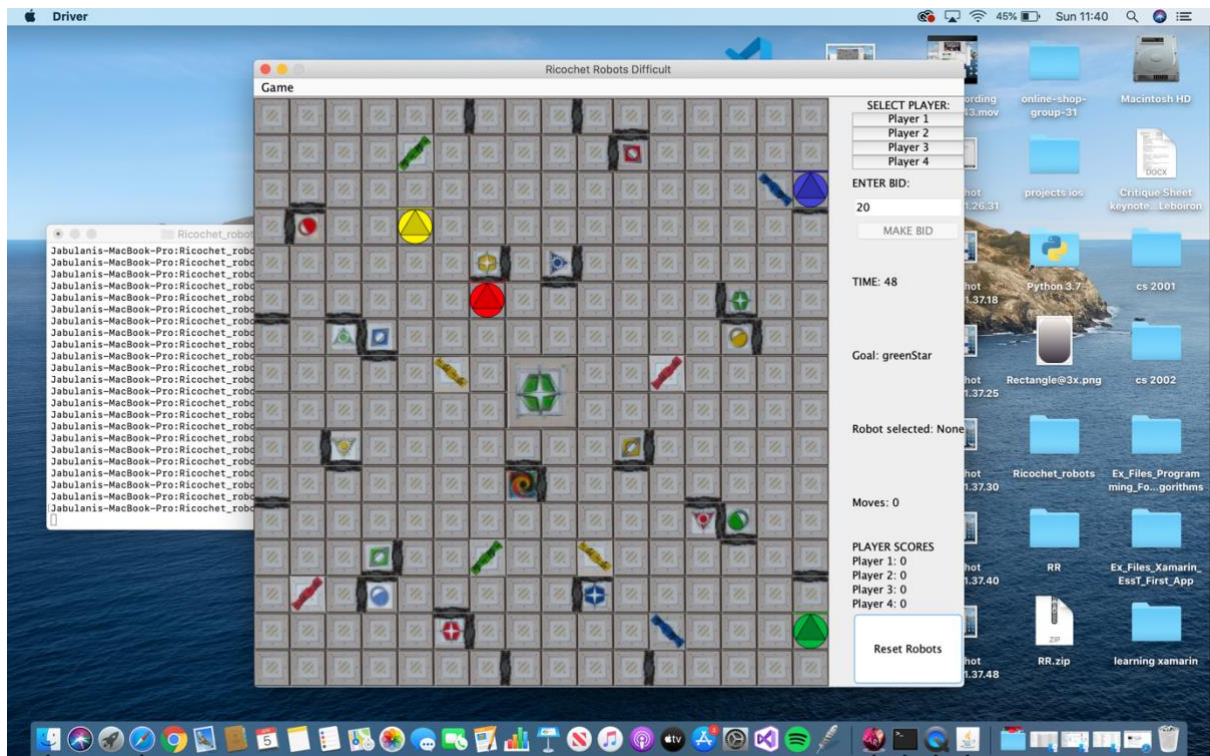

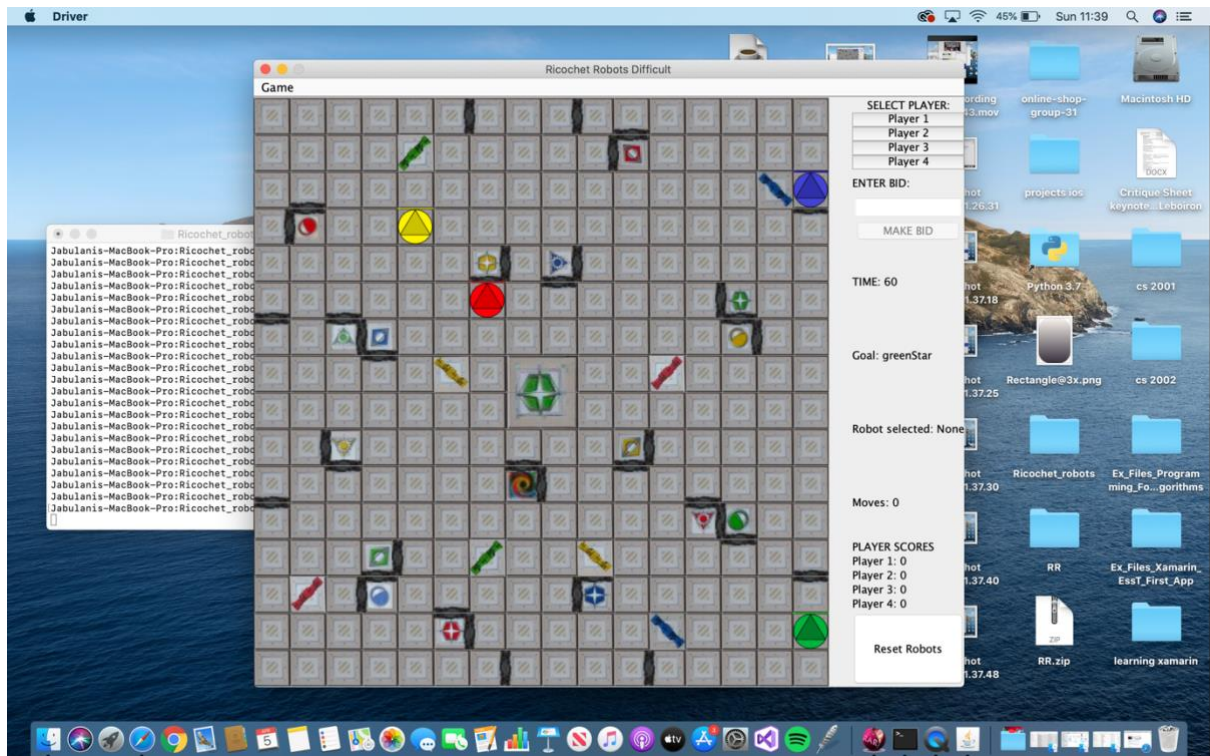

Here the blue robot is selected and then moved left which increments the moves counter on the panel.

The original positions of each robot are left highlighted by the colour. This was implemented in effort to help players not to backtrack too much.

Once a player runs out of time before reaching the goal their turn is concluded and the board resets for the next player to bid.

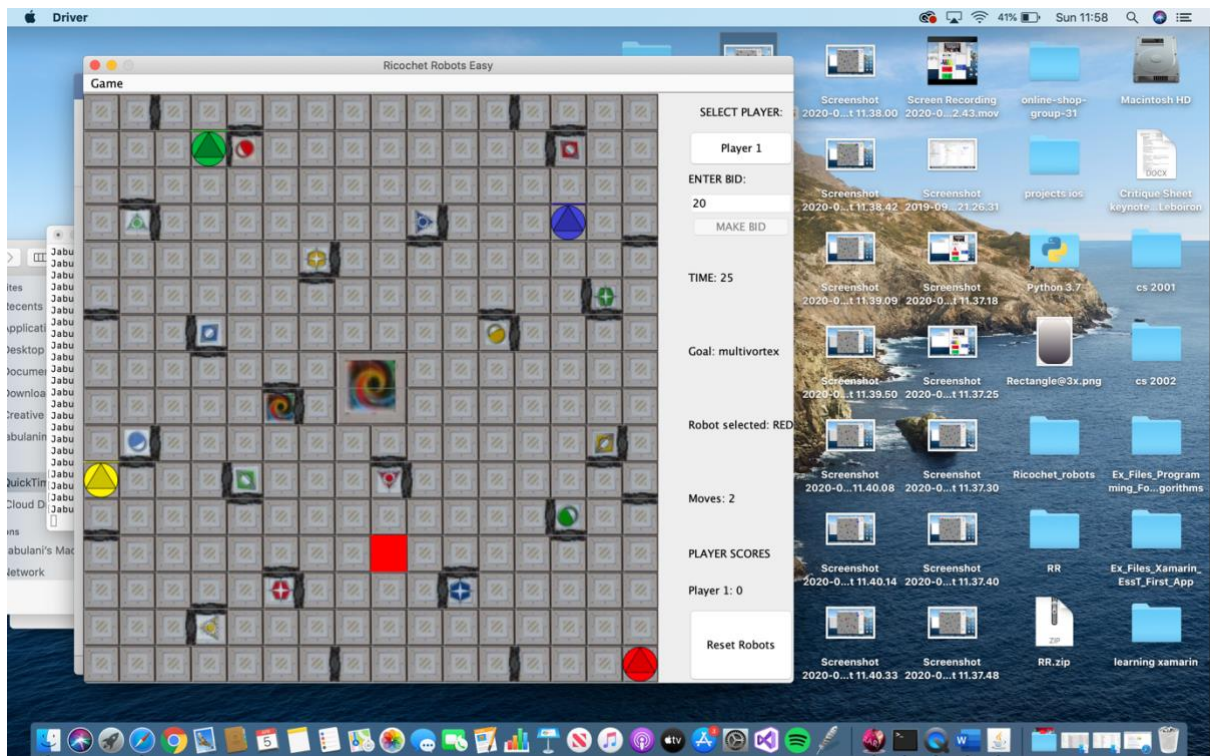

Here after moving the blue robot to the left it encounters a deflective barricade which will cause the robot to be moved upwards instead of continuing further to the left.

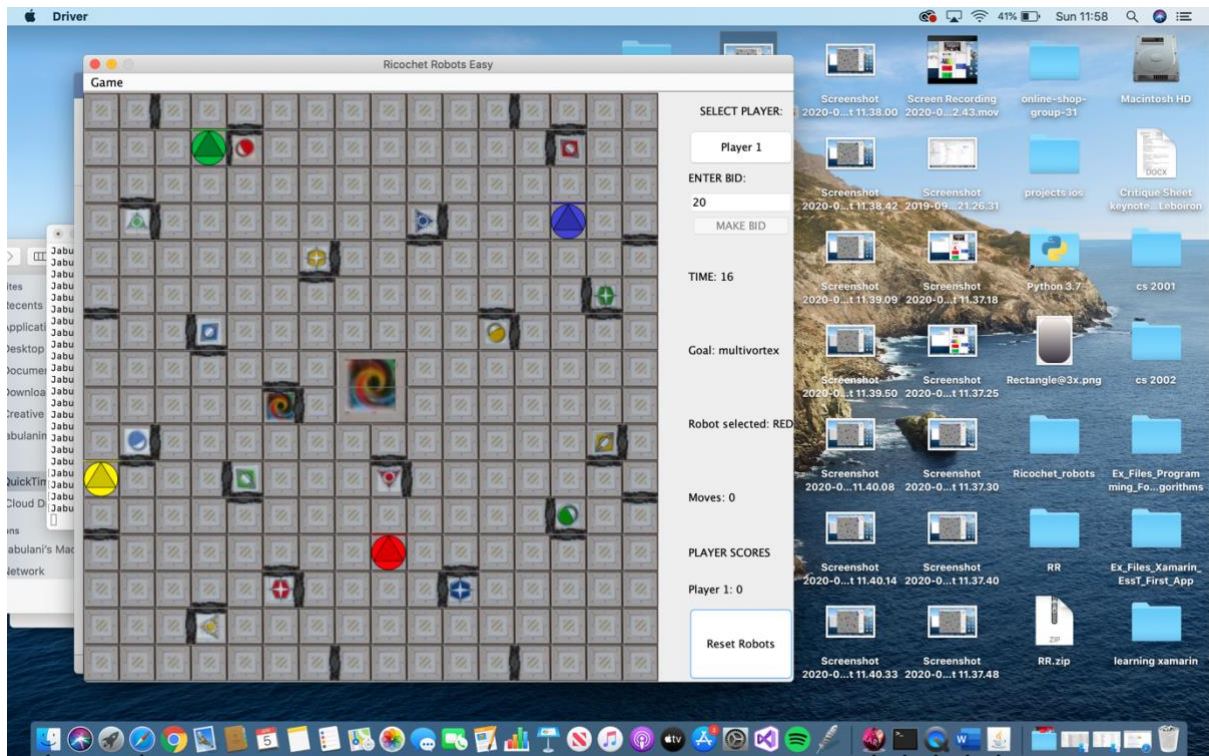

Again Please take note that only the selected robot(indicated here as BLUE) can be moved.

The colour vision support boards will be functionally the same as their normal counterparts

While playing the player can reset their moves and reset the robots by pressing the reset robots button. This will only return the robots to their original positions so you can start over but does not reset your timer.
